

NotionVoiceMemo

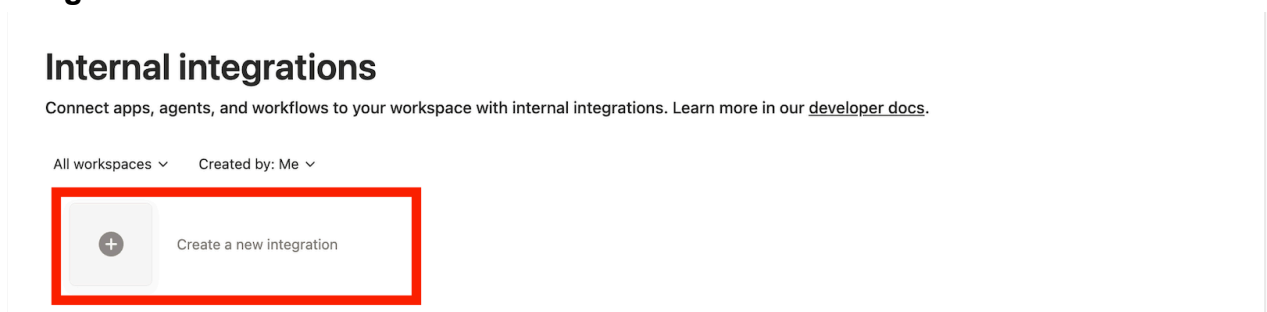

Ultimate Setup & Usage Guide

<https://www.artempavlenko.me/>

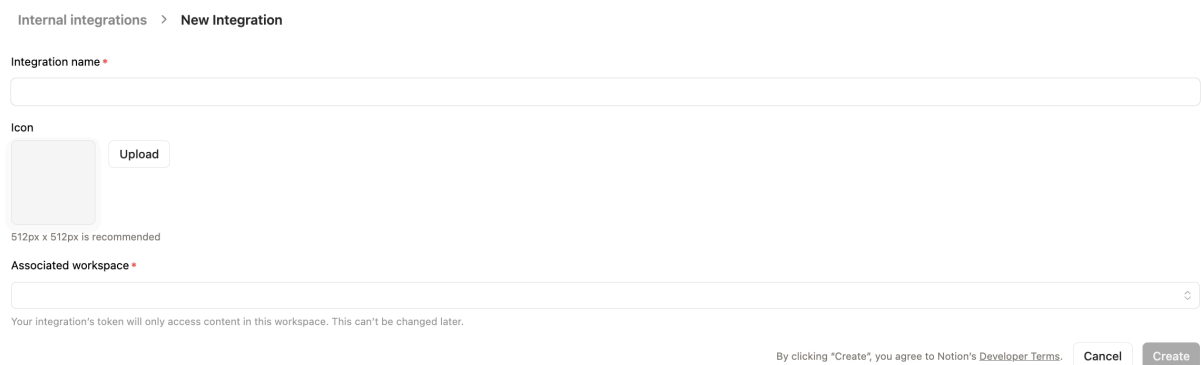

NotionVoiceMemo is an AI-powered agent that captures your voice, transcribes it via **OpenAI Whisper**, structures it with **Gemini 2.5 Flash**, and saves it to Notion with smart dates and priorities.

🔧 Step 1: Create Your Notion Integration

1. **Start New Integration:** Go to [Notion Developers](#) and click the **" + Create a new integration"** button.

2. **Basic Info:** Name your bot (e.g., "Voice Memo Agent") and select the correct **Associated workspace**.

The screenshot shows the 'New Integration' form. It has a breadcrumb 'Internal integrations > New Integration'. The 'Integration name' field is empty. Below it is the 'Icon' section with a placeholder image and an 'Upload' button. A note says '512px x 512px is recommended'. The 'Associated workspace' dropdown is also empty. At the bottom, a disclaimer states: 'Your integration's token will only access content in this workspace. This can't be changed later.' To the right of the disclaimer are 'Cancel' and 'Create' buttons.

3. **Get Your Secret:** Reveal and copy your **Internal Integration Secret** (starts with `ntn_...`) and **Set Capabilities:** Ensure `Read`, `Update`, and `Insert` content permissions are checked.

Integration name *

Voice Memo to Action Items

Icon

Upload

512px x 512px is recommended

Associated workspace

Notion

To change workspace, create another integration.

Internal integration secret

.....

Only works with the . : Notion workspace.

You can change your Notion API at any time.

Capabilities

These requested capabilities will be displayed to users when they authorize your integration. See [developer docs](#) for more help.

Content capabilities

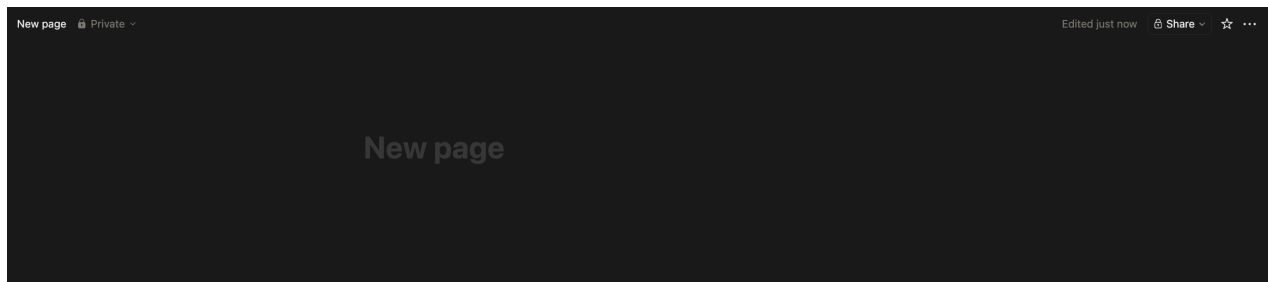

- ☒ Read content
Request to read content.
- ☒ Update content
Request to update existing content.
- ☒ Insert content
Request to create new content.

Comment capabilities

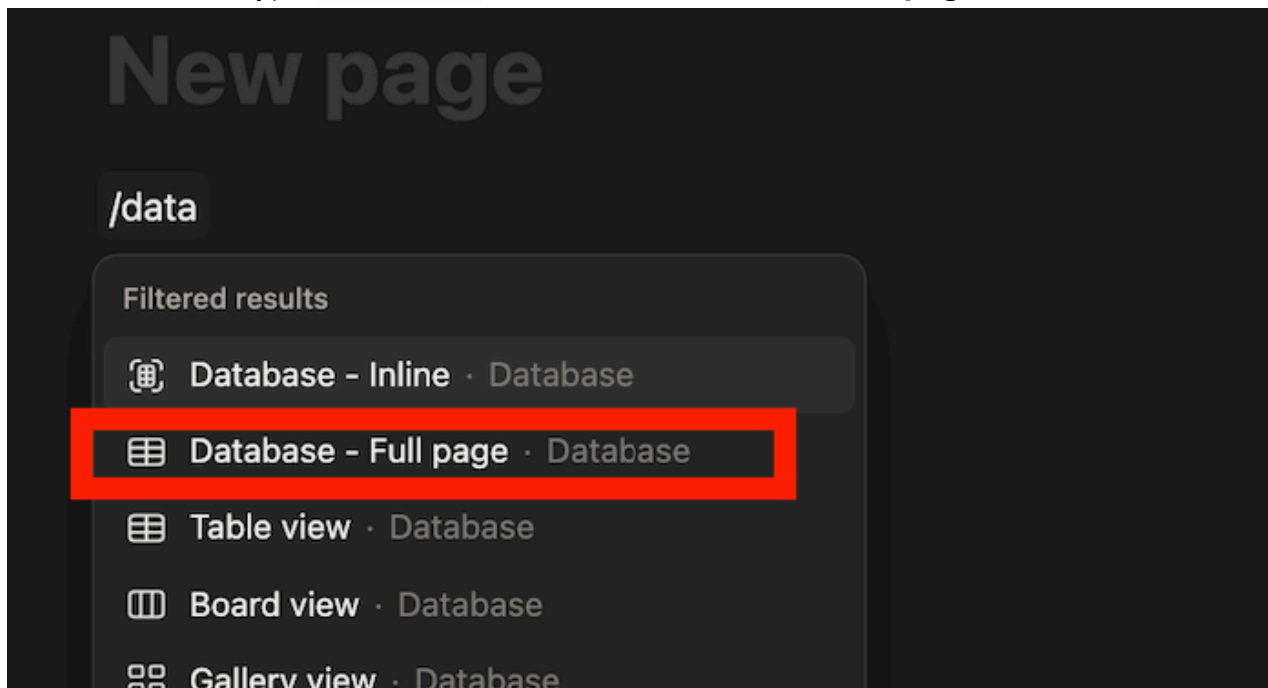

- ☒ Read comments
Read comments on blocks and pages.
- ☒ Insert comments
Create comments on blocks and pages.

Step 2: Prepare Your Notion Database

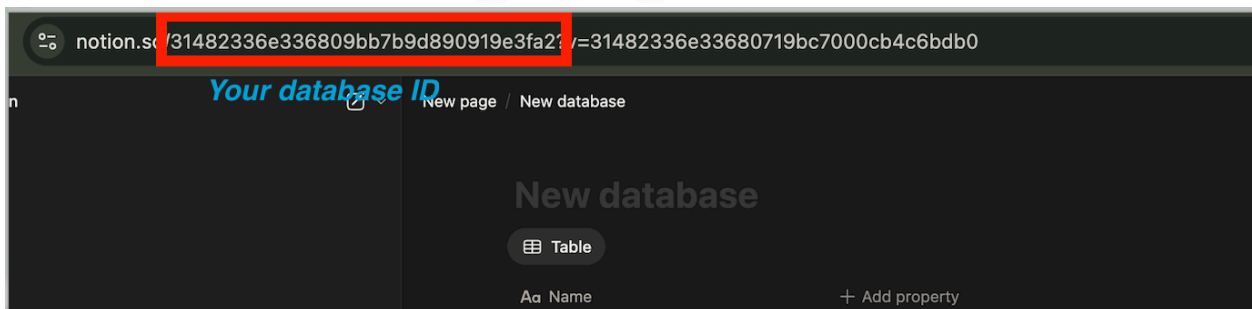

1. **Create Page:** In your Notion workspace, create a **New page**.

2. **Add Database:** Type `/database` and choose **Database - Full page**.

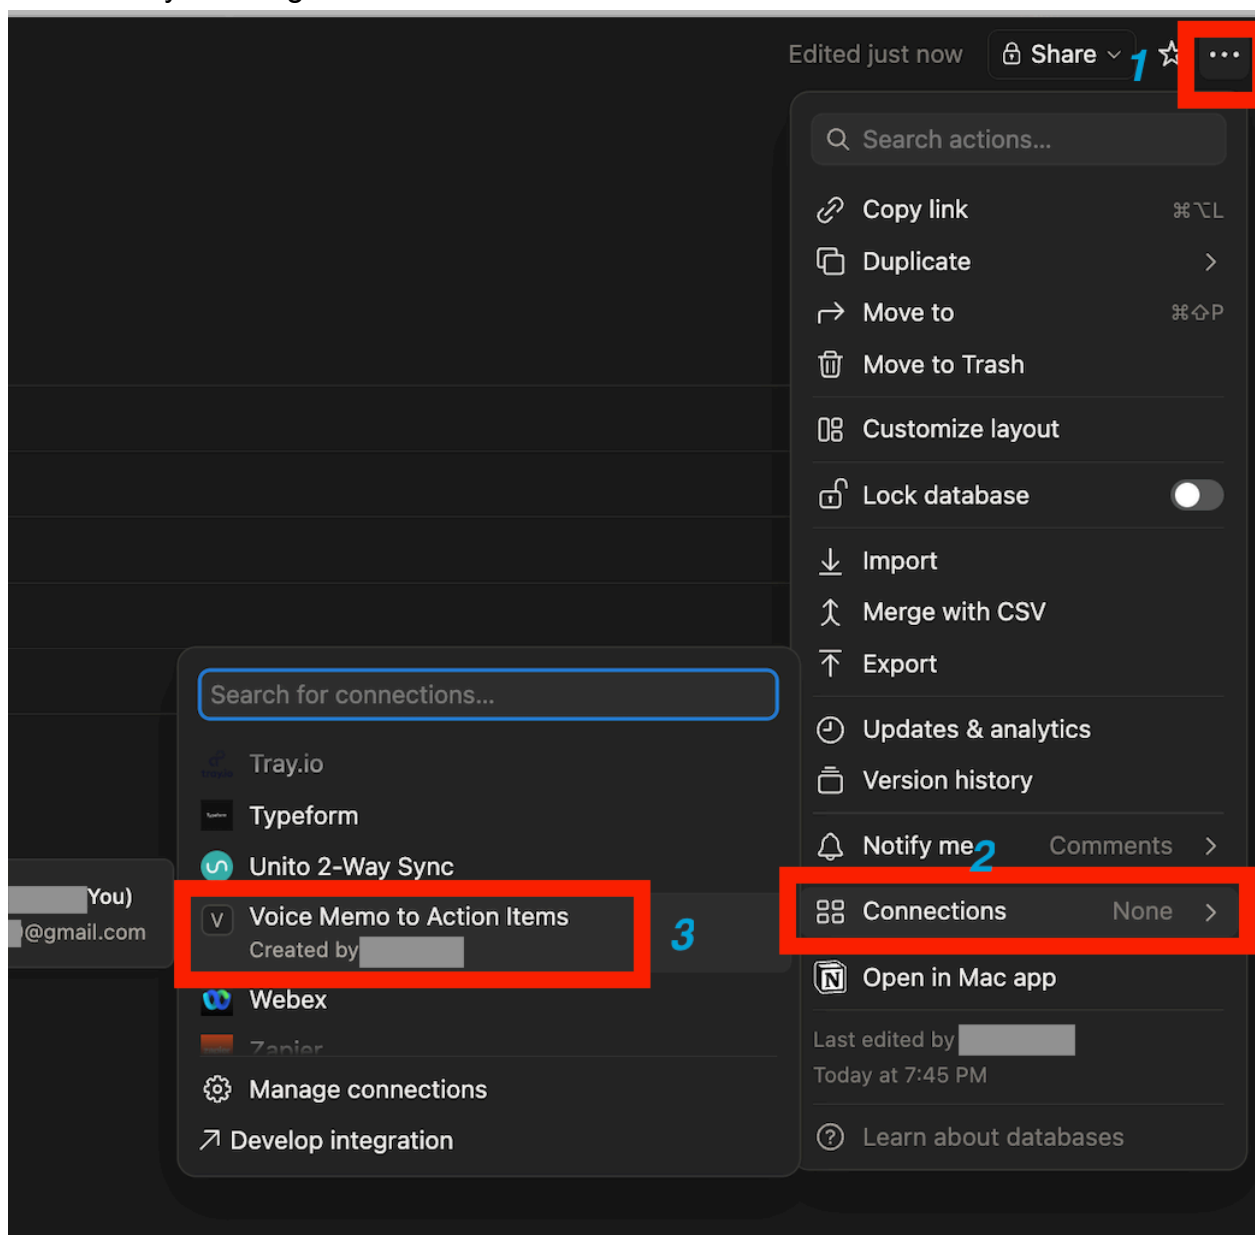

3. **Find Database ID:** Copy the URL of your database. The **Database ID** is the 32-character string between the last / and the ? .

🔌 Step 3: Connect Bot to Database

CRITICAL STEP: Notion blocks all integrations by default. You must manually invite the bot.

1. Open your database and click the **three dots** ... (top right).
2. Select **Connect to** (or Add connections).
3. Search for your integration name and click **Confirm**.

Smart Features

Intelligent Date Calculation

The bot knows the current date is **Friday, Feb 27, 2026**. (example)

- Saying *"for tomorrow"* sets the date to **2026-02-28**.
- Saying *"in 10 days"* sets the date to **2026-03-09**.

Self-Healing & Priority

- **Auto-Priority**: The AI detects importance (**High, Medium, Low**).
- **Auto-Schema**: If the "Priority" or "Date" columns are missing, the bot creates them automatically!
- **To-Do Format**: Tasks are saved as interactive checkboxes in Notion.

Intent Detection (Auto-Cancel)

If you say *"Actually, cancel that"* or *"I'll think later"*, the bot recognizes the **Cancel Intent** and discards the note without saving.

Technical Stack

- **Speech-to-Text**: OpenAI Whisper (Medium).
- **Brain**: Google Gemini 2.5 Flash.
- **Database**: PostgreSQL + Alembic.
- **Infrastructure**: Docker.
